COVID-19: a systematic review of perinatal case series up to April 5, 2020

(Mr.) Inge Axelsson, MD, PhD
emeritus professor of medical sciences, Mid Sweden university
consultant pediatrician (retired), Östersund hospital

This communication consists of two tables from systematic reviews. They are from peer reviewed guidelines in Swedish about COVID-19 (infection with the corona virus SARS-CoV-2), published by www.internetmedicin.se. Their guidelines are not official but highly regarded and much used. My guidelines are compatible with official guidelines, if they exist. Unfortunately, my English is not revised by a translator.

Literature was searched up to April 5, 2020. PubMed was searched for “Covid-19 and pregnancy” and “Covid-19 and child*”. Studies that contained clinical data on mothers and/or newborn babies were selected for inclusion in my review. The reference lists of the selected studies and of review articles were also searched.

Summary of Table 1: Outcome of pregnancies complicated with maternal COVID-19

In 3 cases, symptoms of maternal COVID-19 didn’t appear until the first days after delivery.

Countries: China, Iran and South Korea

Number of deliveries: 130 (vaginal 31, section 96, unknown 3)

Number of live newborns: 129 (one pair of twins, one miscarriage, one child death due to multiple organ failure)

Length of pregnancy at delivery: 25-41 weeks (most newborns were term)

Seriously ill or dead mothers: One mother was treated with ECMO at time of publication (Liu Y, Chen H 2020). To mothers in Iran died in ARDS after delivery; details were not published (Karimi-Zaorchí 2020).

Seriously ill or dead newborn babies: Data in Table 1 indicate that COVID-19 in pregnant women usually has benign courses for mothers and children, at least after infections in the third trimester. However, one pregnancy ended with a miscarriage (Liu Y, Chen H 2020). One child, born after 34 weeks + 5 days, died 9 days old of DIC and MODS. The mother caught fever 3 days after delivery and the child became ill the day before death. The authors mention viremia but it is unclear if it is a finding or a hypothesis. (Zhu 2020)

Vertical transmission: in 19 newborns, viral tests were collected from nasopharynx and/or throat and in another 50 newborns, viral tests were collected from e.g. amnion fluid, umbilical cord, breastmilk, placenta and in most cases also from nasopharynx and/or throat. Four nasopharynx swabs were positive for COVID-19-virus at age 2-3 days. These infants had breathing difficulties but both mothers and infants recovered without problems.
A positive COVID was collected from a newborn in London a few minutes after birth but it was not known if virus had infected the baby \textit{in utero} or in the vagina (Murphy 2020).

Two of 6 newborns delivered by mothers who were moderately ill in COVID-19 had high titers of IgM antibodies for COVID-19-virus. “M” in IgM means “macro”, i.e. the molecule is not usually transferred from mother to fetus because of its size. It is therefore possible that virus has penetrated the fetus and stimulated its production of IgM. This was supported by an increase of interleukin-6 as a sign of infection. The infants were fine with no sign of illness. (Zeng H 2020) Another infant had also high levels of IgM for COVID-19-virus and interleukins 2 hours after birth (Dong L 2020).

</table>

Abbreviations: ARDS, acute respiratory distress syndrome; CS, caesarean section; ECMO, extracorporeal membrane oxygenation; MODS, multiple organ dysfunction syndrome; pp, post partum; PN, partus normalis (normal, vaginal delivery); PROM, premature rupture of membranes.

*In most cases, the pregnant woman delivered within one week after the beginning of COVID-19 symptoms. **In 3 cases, the women became sick in COVID-19 1-3 days after delivery.

**Deleted studies**

Liu H 2020: Very few clinical data.

**Review which have been reviewed for missed primary studies**
